

Matted glass

Sandblasting with a scattering effect

Matt glass can be used wherever light scattering is needed, or glass is used to prevent glare and protect from view.

Glaswerke Haller offers sandblasted **matted glass** which is matted either over the entire surface or which is partially matted glass with the aid of templates or a screen printed masks. In this way, special structures or decorations can be applied to the glass. In addition, the sandblasting process also enables in-depth blasting, to create three-dimensional designs within the glass.

If necessary, the glasses can also be sealed to protect the matted surfaces against dirt or grease.

On request, **matted glasses** can be further treated with organic or ceramic screen printing, and can be produced laminated safety glass and/or thermally toughened glass.
