

Curved glass

Formed glass

In showcases and lights, curved glass is used as a decorative element or for protection and can also be used for the deliberate deflection of light.

Glaswerke Haller bends flat glasses of various types in thicknesses from 2-19 mm. In addition there is also the possibility of bending several glasses so precisely above each other that a curved, laminated safety glass (**Siplex**[®] curved) can be produced. Hence expanded metals or light deflecting films can be incorporated in curved laminated safety glasses.

Processing possibilities:

- Cylindrical bends with various radii
- Spherical bends with various radii
- Printed glasses
- Handling protection on matted glasses
- Bending of special shapes
